The time package*

Mike Piff†

15 Feb 1995

The time package defines a command `\now` which typesets the current time in twelve-hour format. The format is `%l:%M%p`, where `%l` and `%M` denote the hour (without leading zeros) and minute (with leading zeros), and `%p` is either "am" or "pm." The command is fragile.

*This manual corresponds to time.sty v1.0a, dated 15 Feb 1995.
